DICOM Viewer and Validator is an ultra-simplistic piece of software that you can use to open, examine and verify the integrity of DICOM files, exactly as the name says. DICOM Viewer and Validator Publisher: Lichenet DICOM Viewer and Validator Release Date: 2010-09-11 DICOM Viewer and Validator Free Download: File Size: 3 MB DICOM Viewer and Validator Full Version: File Size: 5.81 MB The present invention relates to a method of in situ recovery of oil from underground reservoirs and more particularly to a novel and improved method of in situ recovery of oil from water-sensitive shale, sandstone, carbonate rock and other naturally occurring subterranean deposits of oil. As is well known in the art, in many subterranean reservoirs the type and quantity of oil to be recovered is limited by the hydrocarbon saturation of the reservoir, usually resulting from the geologic structure of the reservoir. The amount of oil initially present in the reservoir may be considerably less than the amount which can be recovered by conventional production methods. In some instances, the oil may have diffused from a more permeable trap into a less permeable trap, thus rendering a portion of the reservoir unusable. Thus, it has become the practice to introduce remedial agents into the reservoir to force the oil from the more permeable traps into the more permeable traps. There are several methods available for introducing such remedial agents into the reservoir. The most common of these is through the use of injection wells. A series of injections is normally conducted by introducing the remedial agent into the injection well at the head of the reservoir and permitting the remedial agent to penetrate the reservoir by means of gravitational forces. This procedure may require many months of injection and in some instances the reservoir may become depleted of hydrocarbon as a result of the introduction of the remedial agent. Another method of introducing remedial agents into a reservoir is through an in situ combustion process. In this method the remedial agent is normally injected into the injection well and a flame front is produced in the reservoir. As the flame front moves through the reservoir, the hydrocarbons are decomposed, thus forcing additional crude oil from the formation into the well with the formation gases.
