The series is about four singles in Bangkok (not Bangkok Love Stories) who meet one another in a salon. The salon is located in Sukhumvit at the Santa Monica Hotel where the telenovela will be filmed. The Sun is a foreigner who is an escapee from the army who has been living in Thailand for a while now. He is an old friend of Kai's dad, but Kai doesn't know him at all. Kai is a 28-year-old Thai woman who manages the salon. She is a single mother of Ror. Her parents passed away when she was young. The other 3 singles are: Pong – (played by Yantha Teerapirom) is a romantic guy who is currently single but he wants to get married. He has a popular Thai girl as a girlfriend and also talks a lot about her. Phattak – (played by Nattapong Wongpak) is a good looking guy who is a pilot. He has a girl but she doesn't really want to be his girlfriend and he doesn't know how to deal with her. Sticky – (played by Ratchadapol Thongpipattanakul) is a role model for everyone. He is pure, he has a girl but doesn't talk about her. He is a fashion model by trade. Pompah – (played by Ainsun Abisarnpura) is a girl and is the most popular in the salon. She is a fashion model and she has been dating the same guy for a long time. He is a photographer by trade, and he loves to take pictures of others.An early look at the 12th poll results for the Karnataka Assembly

The flower is an apomictic complex organ arising through the aggregation of individual sepals, petals and stamens. In Arabidopsis, the polar repression of organ identity by the APETALA3 (AP3)/PISTILLATA (PI) gene complex is essential for maintaining the meristematic-floral fate. Here, we have characterized the molecular organization of the Locus Control Of Petal (LCP), a 23 kb genomic region located approximately 50 kb upstream of the AP3 gene in the PI locus. The domain organization of the LCP locus is similar to that of the flower organ identity gene Antirrhinum CENTRORADIALIS (CEN) in that it comprises three distinct subdomains. A previously unidentified transposable element has been found integrated in the central domain of the LCP locus. Three families of B2/3 repeat elements have also been identified in the LCP locus. The first family, which contains 25 members, is the most abundant and closely related to the CEN family. The third family is very abundant and contains one B2/3 repeat with a low degree of sequence similarity to the other repeat families. This repeat represents a new class of B2/3 repeat. Other elements were also isolated within the LCP locus. Their integration patterns suggest that the LCP locus was derived from the genomic region upstream of the AP3 gene through a series of transposition events. The transposition mechanisms of most of these repeated sequences have not yet been investigated. The expression patterns of the AP3/PI and LCP genes have been determined using both
