minecraft jars are not entirely opaque; they can be cracked by editing files and recompiling the jar. as soon as you create a new class file, you can crack the.jar and see all the class files and what they are. the code in minecraft is hard to crack, but not impossible. an example of this is the recent release of the 0.30.2 i9000 homing arrows, which are the very first version with homing arrows in the world. the files show that the arrows are actually vanilla arrows, but they have been replaced with new classes that have modified code in them. this can easily be seen by the fact that the new arrows do not include any function calls that call the original's, they only call the modified functions. this also means that they can be easily modified to act like the vanilla arrows if the original classes are edited. some of the major changes introduced in infdev were the introduction of sand and lava, the addition of several new mobs, including a few new types of mobs, and the introduction of mobs that could be used to tame animals. there were also a few more changes in the leveling system, such as the addition of the infdev servers and of the infdev console. the infdev servers is similar to the classic servers but there are no servers and no consoles except for the infdev console. the infdev servers were used for testing purposes to make sure that the game worked. the infdev console is a window that can be opened by the player to change variables such as level, world generation, spawning, etc. the only other form of leveling in the game is when the player levels up, after which they are given more experience to level up. 5ec8ef588b
